EUDAT Three Years On
Tuesday 17 Mar 2015 at 14:00 (00h25')

Content:
EUDAT is a major horizontal project in data management funded under the European union Framework 7 program aimed at providing common data management services in a cross disciplinary regime. Uniquely, it has brought together major European data centres, technology providers and science communities across a wide range of disciplines. EUDAT was presented at ISGC2012 and is currently coming to the end of its initial finding cycle. At this initial presentation, which was very early in the project lifecycle, the aims of the project were presented together with a list of planned services. EUDAT is still an active project and several more organisations have expressed an interest in using these underlying services.

In this talk we provide an update on the evolution of the services, moving from testing into stand-alone services and moving towards an integrated product suite. We also consider the work performed so far on looking at sustainability and federated authentication and authorisation. Finally we look to the future, looking at changes to the way user access the change of service, work done on improving modularity and future services.
